Population 1970 and 1980 by County	7
Projected Population 1990 and 2000 by County	7
1980 Population by County by Age, Race, and Sex	11
1990 Projected Population by County by Age, Race, and Sex	15
2000 Projected Population by County by Age, Race, and Sex	19
Map - Population Change 1980 - 2000	23
Map - Net Migration 1980 - 2000	24

Preface

The population projections presented in this report are demographic projections of future population. They are not a forecast. A demographic projection is a statistical methodology which examines historical trends, fertility and mortality. These projections represent reasonable expectations of what the future population will be assuming no sudden or large changes to present patterns. For example, if an area develops strategies for attracting business and industry at a rate above their current level, it will not be reflected in these projections. Our purpose in distributing these projections is to provide planners a reasonable set of population projections to work from in designing facilities and providing new services.

Summary

The State of Georgia is expected to increase its population by almost two million persons by the year 2000. A large part of the increase (over 1 million) will be in the fifteen county metropolitan Atlanta area. Over 1.1 million of the increase will be the result of net migration. From 1970 to 1980 Georgia ranked as the fifth fastest growing state in the country in terms of population gain. This growth pattern is expected to continue in the period 1980-2000.

Without question, the Atlanta metropolitan area will be the focal point of the State's population growth from 1980 to the year 2000. In 1970, five of the State's twenty largest counties were in the Atlanta SMSA. By the year 2000 nine of the largest twenty will be in the Atlanta SMSA. The largest four counties will all be located in the Atlanta area, Fulton, Dekalb, Gwinnett, and Cobb.

The county with the largest population increase from 1980 to 2000 will be Gwinnett, increasing over 270,000 persons. Fayette is the county with the largest projected percent increase, over 300 percent for the 1980-2000 period. Other counties experiencing a high percent increase for the same period of time are Camden, Gwinnett, Henry, Lee, Liberty, and Rockdale. Only three counties, Calhoun, Stewart, and Taliaferro are expected to lose population. This continues a trend started in 1960 of many of Georgia's counties sharing in the State's tremendous growth.

The number of persons age 65 and over will continue to increase as a percent of Georgia's total population. In 1970, 8.01 percent of the State's population was 65 and over. By 1980, 9.46 percent was 65+ and this percent will increase to 10.66 by the year 2000.

A dramatic decrease is expected in the percent of population age seventeen and under. In 1970, the percent was 35.83, and by 1980, it had fallen to 30.13. We expect the decline to continue and reach 26.02 percent by the year 2000.

Camden County will experience an increase in population due to the military facility at Kings Bay. Other non-civilian populations are expected to remain the same.

Methodology

A cohort-component procedure was utilized to make the population projections for 1990 and the year 2000. This methodology worked well in Georgia when tested against the 1980 Census.

The cohort-component method examines the three elements of population change. They are 1) fertility (births), 2) mortality (deaths), and 3) migration. If we know the number of births and deaths, and we know the net movement of people in and out of a given area, we should be able to project the future population.

Our approach was a "top down" methodology. That is, we projected the state's population and then controlled each county to the projected state total. We feel like this is essential to any methodology before making county level projections. It is much sounder statistically to work with a large geographic area and population base initially rather than adding up all of the parts independently projected. The methodology may be described as follows:

- 1) Computation of net migration for the previous decade by age, race, and sex by county.

$$\begin{array}{rcl} \text{Population} & \times & \text{Survival} \\ \text{Year 1} & & \text{Rate} \end{array} = \begin{array}{c} \text{Expected} \\ \text{Population} \\ \text{Year 2} \end{array}$$

$$\begin{array}{rcl} \text{Actual} & & \text{Expected} \\ \text{Population} & - & \text{Population} \\ \text{Year 2} & & \text{Year 2} \end{array} = \begin{array}{c} \text{Net Migration} \\ \text{For the Time} \\ \text{Period} \end{array}$$

- 2) Projection of population for the upcoming decade by age, race, and sex by county.

$$\begin{array}{rcl} \text{Population} & \times & \text{Projected} \\ \text{Year 2} & & \text{Survival} \\ & & \text{Rates} \end{array} = \begin{array}{c} \text{Expected} \\ \text{Population} \\ \text{Year 3} \end{array}$$

$$\begin{array}{rcl} \text{Expected} & & \text{Net Migration} \\ \text{Population} & \times & \text{Rate} \\ \text{Year 3} & & \end{array} = \begin{array}{c} \text{Net Migration} \\ \text{For the Time} \\ \text{Period} \end{array}$$

$$\begin{array}{rcl} \text{Expected} & & \text{Net Migration} \\ \text{Population} & + & \text{For the Time} \\ \text{Year 3} & & \text{Period} \end{array} = \begin{array}{c} \text{Projected} \\ \text{Population} \\ \text{Year 3} \end{array}$$

3) Computation of births for the decade by race and sex by county.

$$\begin{array}{lcl} \text{Average Births} & \text{Female Population} & = \text{County General} \\ \text{For Base Year} / & \text{Age 15-44 For Year 1} & \text{Fertility Rate} \\ & & \text{For Base Year} \end{array}$$

$$\begin{array}{lcl} \text{County General} & \text{U.S. General} & \\ \text{Fertility Rate} & \text{Fertility Rate} & = \text{Fertility Ratio} \\ \text{For Base Year} / & \text{For Base Year} & \text{For Base Year} \end{array}$$

$$\begin{array}{lcl} \text{Fertility Ratio} & \text{U.S. General} & \text{County General} \\ \text{For Base Year} \times & \text{Fertility Rate} & = \text{Fertility Rate} \\ & \text{For First Half} & \text{For First Half} \\ & \text{of Decade} & \text{of Decade} \end{array}$$

$$\begin{array}{lcl} \text{Fertility Ratio} & \text{U.S. General} & \text{County General} \\ \text{For Base Year} \times & \text{Fertility Rate} & = \text{Fertility Rate For} \\ & \text{For second Half} & \text{Second Half of} \\ & \text{of Decade} & \text{Decade} \end{array}$$

$$\begin{array}{lcl} \text{County General} & \text{Female Population 15-44} & \text{Projected Births} \\ \text{Fertility Rate} \times & \text{For Midpoint Year} & \times 5 = \text{For Half of} \\ & \text{Ex. 83 or 88} & \text{Decade} \end{array}$$

Calculate Proportion Male and Female.

4) Apply assumptions to net migration table.

If the net migration is positive and the population density per square mile is:

- a) Less than 250 - No adjustment
- b) 250-499 - 90 percent factor applied to net migration
- c) 500-749 - 80 percent factor applied to net migration
- d) 750-999 - 70 percent factor applied to net migration
- e) 1000-1249 - 60 percent factor applied to net migration
- f) 1250-1499 - 50 percent factor applied to net migration
- g) 1500-1749 - 40 percent factor applied to net migration
- h) 1750-1999 - 30 percent factor applied to net migration
- i) 2000 or over - 25 percent factor applied to net migration

If the net migration is negative and the population density per square mile is:

- a) Less than 100 - 75 percent factor applied to net migration
- b) 100-500 - 50 percent factor applied to net migration
- c) over 500 - 25 percent factor applied to net migration

The result of the above adjustment is to slow growth due to migration in densely populated areas and reduce the movement out of areas currently losing population.

5) Apply U.S. Fertility Rates as follows:

White Females Age	1980-1985	70.7
15-44 (Per 1,000)	1985-1990	70.6
	1990-1995	68.1
	1995-2000	64.8

Non-White Females	1980-1985	82.7
Age 15-44 (Per 1,000)	1985-1990	76.8
	1990-1995	71.0
	1995-2000	67.2
